Recommended page allocation

Section	Expected length
Abstract and Keywords	½ page
1. Introduction	1 page
2. Literature Survey / Related Work	1½ pages
3. Base Paper Analysis and Research Gap	1 page
4. Problem Statement and Objectives	½ page
5. Proposed Methodology	3–4 pages
6. Implementation / System Design	1 page
7. Results and Discussion	3–3½ pages
8. Conclusion and Future Work	½ page
Total report content	12–13 pages

Detailed report format

Cover Page — excluded from page count

Include:

- Mini Project Title
- Base Research Paper Title
- Student names, roll numbers and email ids
- Department and institution
- Course / semester
- Academic year

Abstract and Keywords — ½ page

The abstract should briefly describe:

- The problem being addressed.
- The limitation of the base paper.
- The proposed improvement.
- The method or technique used.
- The key results obtained.

Include 4–6 keywords below the abstract.

1. Introduction — 1 page

Students should explain:

- Background and significance of the problem.
- Existing approaches and their limitations at a high level.
- Motivation for improving the base paper.
- Brief overview of the proposed work.

The introduction should establish the need for the project without becoming a lengthy textbook-style explanation.

2. Literature Survey / Related Work — 1½ pages

Students should review relevant research papers, including their base paper.

For each important work, briefly identify:

- The problem addressed.
- The approach used.
- The main findings.
- The limitations relevant to the mini project.

A comparison table is required including the proposed work, using the following format:

Reference Problem Addressed Approach / Technique Key Contribution Limitation

Students should cite the original papers rather than merely listing their titles.

3. Base Paper Analysis and Research Gap — 1 page

This section is particularly important for your mini projects.

Students should describe:

- The main objective and approach of the base paper.
- Its important contributions.
- The limitations identified by the authors or through their own analysis.
- The specific research gap or improvement opportunity addressed by their project.

They must clearly distinguish the original contribution of the base paper from their proposed improvement.

4. Problem Statement and Objectives — ½ page

Include:

- A precise statement of the problem.
- Two to four specific project objectives.

- The scope and expected outcome of the improvement.

Objectives should be measurable wherever possible.

5. Proposed Methodology — 3–4 pages

This should be one of the most detailed sections.

Suggested subsections:

- 5.1 Overview of the Proposed Approach
- 5.2 Architecture / Framework
- 5.3 Proposed Algorithm or Technique
- 5.4 Modifications to the Base Paper
- 5.5 Step-by-Step Working Procedure
- 5.6 Algorithm or Pseudocode, wherever applicable

Students should include architecture diagrams, flowcharts, equations, algorithms, or model designs as appropriate to the project.

The modifications must be explained technically: what was changed, why it was changed, and how the change is expected to address the identified limitation.

6. Implementation / System Design — 1 page

Include the relevant implementation details:

- Software, tools, frameworks, datasets, or hardware used.
- System configuration and important parameter settings.
- Implementation workflow.
- Important modules and their functions.

For software or simulation projects, students should specify the experimental setup sufficiently for another person to reproduce the work. Avoid filling this section with lengthy source code.

7. Results and Discussion — 3–3½ pages

This section should provide evidence that the proposed improvement works.

Suggested subsections:

- 7.1 Experimental Setup and Evaluation Metrics
- 7.2 Results of the Base Paper / Baseline
- 7.3 Results of the Proposed Method
- 7.4 Comparative Analysis
- 7.5 Discussion of Findings and Limitations

Students should present relevant graphs, tables, screenshots, and numerical results.

They should explain what each important result indicates, compare the proposed method against the baseline under comparable conditions, and discuss whether the objectives were achieved.

Important: Students must not invent results or claim improvement without supporting evidence. If the original paper's results cannot be reproduced, they should state how the baseline was obtained and explain the limitations.

8. Conclusion and Future Work — ½ page

Summarize:

- The problem addressed.
- The improvement proposed.
- The principal results.
- The main limitations.
- One or two possible directions for future work.

References — excluded from page count

Use IEEE reference format. Include all related papers, datasets, tools, and other technical sources cited in the report. Every in-text citation should have a corresponding reference entry.

The Similarity Score and AI-Generated Content Score must each be less than 10%.

First Draft Submission (Softcopy): 26th Oct 2026 on or before 4pm
